Sprint 2: Resume

Platform: Windows

Languages: C++, Java, Visual Basic,

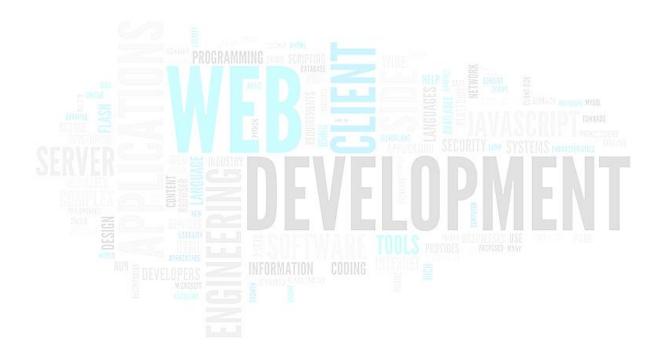

x86 Assembly, HTML, CSS, PHP, & Javascript

The purpose of this project is to create a living resume to show potential employers. I am more interested in back-end development, but am very motivated to learn front-end development as well. By learning front-end development, I expand my knowledgebase and become more versatile in the field of computer programming.

## Spring 2 Deliverable

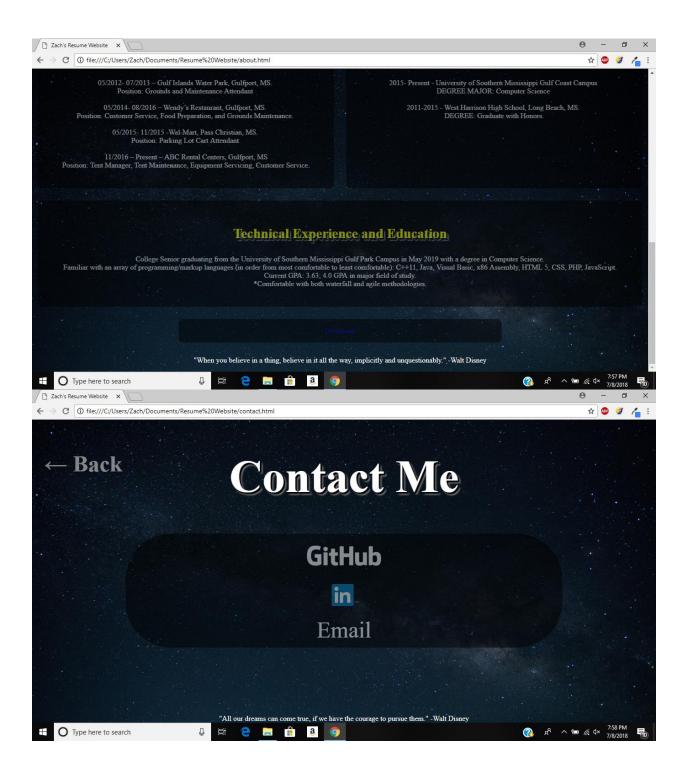

## **Summary of Work Completed**

Most of the time spent toward this project was researching other website designs and building a foundation of HTML and CSS. I created three separate pages for my website: "Home", "About", and "Contact". The Home page consists of an image for me and the header for the website. "About" consists of my actual resume, along with an option to download a more readable copy of my resume. "Contact" consists of links for my GitHub, LinkedIn, and my Email.

## Retrospective

I do not believe anything necessarily went wrong with the building of the website. I do wish I had a better foundation of the languages, though. I spent more time than expected on the website. Many hours were spent on the design

as well as tampering with the different CSS attributes and how to use them and what affect they have on the website. There were some moments when I would spend between 15 and 45 minutes trying to figure out why something wouldn't align correctly or why the design wasn't what I had expected, or even just trying to fix a syntax error. For example, there was an instance where I placed "color = white;" instead of "color: white" and it took a while to find the bug. There was a lot that went right with the website. Before I started, I didn't have much motivation to create the website. Once I started, I found the process of creating a website to be fun. I believe I exceeded the minimum requirements of this project as I already created a separate "About" page and "Contact" page. I wanted to try to incorporate Javascript in the website, but I did not know what I would have used it for. For the next sprint, I will try to meet the minimum requirements, as well as incorporate Javascript and make my navigation bar appear on all of my pages instead of just the homepage. I spent more hours on this project than I originally planned for and I hope the deliverable shows that effort.
