Sprint 3: Resume

Platform: Windows

Languages: C++, Java, Visual Basic,

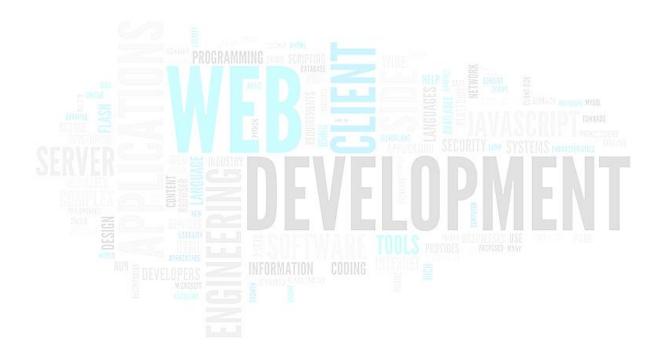

x86 Assembly, HTML, CSS, PHP, & Javascript

The purpose of this project is to create a living resume to show potential employers. I am more interested in back-end development, but am very motivated to learn front-end development as well. By learning front-end development, I expand my knowledgebase and become more versatile in the field of computer programming.

## Spring 3 Deliverable

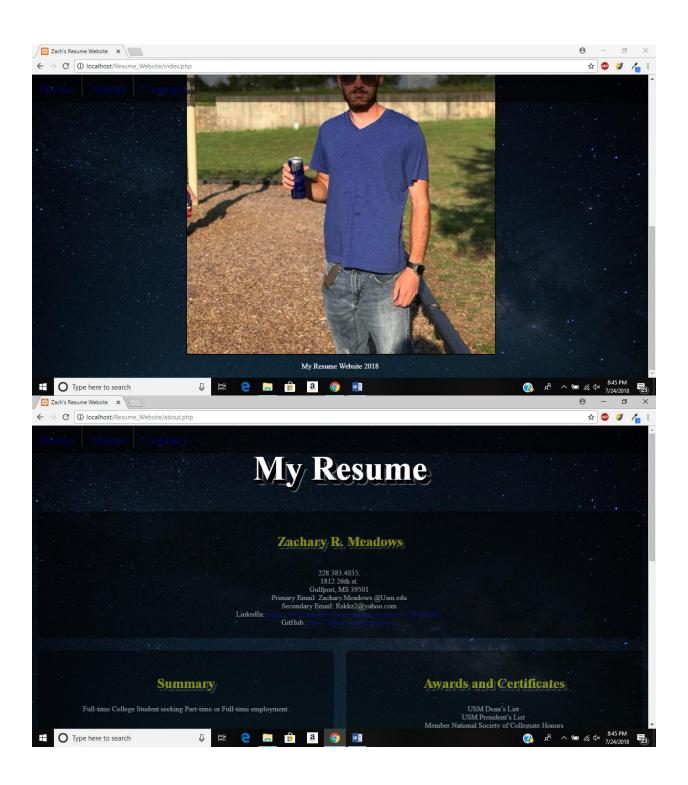

## **Summary of Work Completed**

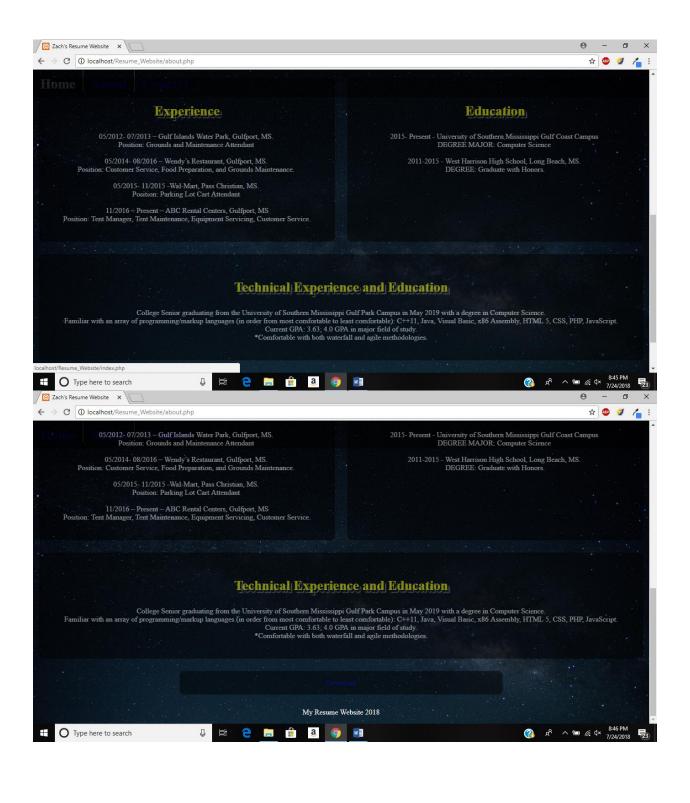

Most of the time spent toward this project was spent separating my navbar, header, and footer into separate PHP files. I was unable to utilize Visual Studio Code successfully but downloaded Xampp web server and was able to use that. Also, comments were added into my php files to explain my code. A contact form was also added to the "About Me" section of the website but does not work. I was also able to have my navigation bar visible on all pages of the website.

## Retrospective

For this sprint, I did not dedicate as much time as I originally intended. I wanted to incorporate javascript into the website but was unable to due to time constraints. For my very first website, I am very pleased with the overall design. I

think I did fairly well with the assignment and hope to learn more about web programming and web design because the process of creating this website was very fun and challenging.
